

Maisons-Alfort, le 20 août 2008

AVIS

de l'Agence française de sécurité sanitaire des aliments relatif à l'autorisation de mise sur le marché à titre dérogatoire pour des spécialités phytopharmaceutiques à base de diméthoate pour lutter contre la mouche de la carotte

LA DIRECTRICE GENERALE

L'Agence française de sécurité sanitaire des aliments (Afssa) a été saisie le 19 août 2008 par la Direction générale de l'alimentation d'une demande d'avis concernant un projet de dérogation visant à l'utilisation de trois produits à base de diméthoate pour lutter contre la mouche de la carotte, en particulier sur le risque de dépassement, à la récolte, de la limite maximale en résidus (LMR) européenne du diméthoate fixée à 0.02 mg/kg, dans le cadre de 3 applications, effectuées à 7 jours d'intervalle, sur carotte, de 200 g de substance active par hectare, la récolte ayant lieu 35 jours après la dernière application.

Après examen par la Direction du végétal et de l'environnement, l'Agence française de sécurité sanitaire des aliments émet l'avis suivant.

La Limite Maximale en Résidus (LMR) est une valeur concernant le produit agricole à l'état "brut" (fruits, grains, légumes, viande, lait, etc.) avant toute transformation et qui doit être respectée pour toutes les conditions d'utilisation de la substance active afin de garantir un niveau de risque acceptable pour le consommateur.

Pour le diméthoate, le résidu recherché dans les denrées d'origine végétale est la substance active (diméthoate) et son principal métabolite (l'ométhoate). La LMR est fixée à 0.02 mg/kg (somme des limites de quantification des résidus de diméthoate et d'ométhoate) pour toutes les cultures « racines » (dont la carotte) (directive 2002/71/CE). Dans le cadre de l'entrée en vigueur du règlement 396/2005/CE fixant les LMR européennes, cette valeur a été confirmée par le règlement 149/2008.

Le respect des Bonnes Pratiques Agricoles (BPA) d'utilisation du produit au champ (dose de substance active par hectare et par application, nombre d'applications, intervalle entre applications, délai avant récolte) ne doit pas conduire à un dépassement de la LMR fixée.

Considérant les données disponibles au niveau européen sur carotte, il n'est pas possible de garantir que les BPA proposées permettront de respecter cette LMR. En effet, lors de la rédaction de la monographie de cette substance active, l'usage sur carotte n'a pas été évalué (voir extrait de la liste des points finaux en Annexe I).

Par ailleurs, comme le mentionne le rapport établi par le Royaume Uni en 2002 en vue de la fixation des LMR sur cette culture (voir annexe II), les données européennes étaient insuffisantes. Seule l'Allemagne disposait de données résidus (voir annexe III), mais liées à des pratiques très différentes de celles proposées dans la saisine et aboutissant à des niveaux de résidus bien supérieurs aux limites de quantification du diméthoate et de l'ométhoate.

Toutefois, considérant les données fournies à notre demande, par la société CHEMINOVA, seul membre de la « task force diméthoate » à nous avoir transmis des résultats d'essais résidus, il

est possible d'évaluer le risque de dépassement de la LMR fixée sur carotte, en fonction des BPA proposées.

Les essais fournis ont tous été conduits dans la zone Nord de l'Europe (6 au Royaume Uni, 5 en France et 1 au Danemark), en utilisant deux formulations codées CHA3619-02 (8 essais) et CHA3621-02 (4 essais). Ces deux formulations sont de type EC et titrent 400 g/L de diméthoate .

Quatre applications de 240 g/ha de substance active ont été effectuées à 7 jours d'intervalle en respectant un Délai Avant Récolte (DAR) variable de 21 à 42 jours.

Dans 4 essais conduits en 2004 le DAR maximum est de 28 jours et dans les 8 autres, des données sont disponibles pour un DAR de 35 jours.

Les méthodes analytiques utilisées ont été validées afin de respecter, tant pour le diméthoate que pour l'ométhoate, une limite de quantification dix fois inférieure à celle des méthodes utilisées lors des contrôles (0.001 mg/kg)

L'ensemble de ces essais tels que résumés dans le tableau suivant aboutit à des niveaux de résidus inférieurs à la LMR fixée sur carotte.

N° essai	Pays	Date du dernier traitement	Stade à la dernière application	diméthoate (mg/kg)	ométhoate (mg/kg)
AF/8163/CN/1	UK	16/09/2004	BBCH 45-47	0.001 (28j)	0.005 (28j)
AF/8163/CN/2	UK	16/09/2004	BBCH 47	0.008 (28j)	0.008 (28j)
AF/8163/CN/3	FR (71)	05/07/2004	BBCH 48	<0.001 (28j)	0.001 (28j)
AF/8163/CN/4	FR (49)	30/09/2004	BBCH 48	<0.006 (28j)	0.006 (28j)
AF/8797/CN/1	UK	06/09/2005	BBCH 48	0.001	0.006
AF/8797/CN/2	UK	07/10/2005	BBCH 48	0.002	0.002
AF/8797/CN/3	FR (49)	24/10/2005	BBCH 48	<0.001	0.003
AF/8797/CN/4	FR (49)	12/10/2005	BBCH 42	<0.001	0.001
AF/11415/CN/1	UK	24/07/2007	BBCH 43	<0.001	<0.001
AF/11415/CN/2	UK	03/08/2007	BBCH 16	<0.001	<0.001
AF/11415/CN/3	FR (49)	14/08/2007	BBCH 43	<0.001	<0.001
AF/11415/CN/4	DK	05/09/2007	BBCH 47	<0.001	0.001

Les plus hauts niveaux de résidu sont observés dans les essais pour lesquels les dernières données disponibles sont obtenues 28 jours après le dernier traitement, le plus haut niveau de résidu (HR) étant de 0.016 mg/kg

Il convient de noter que les données disponibles ont été obtenues uniquement dans la zone Nord de l'Europe, et que deux formulations ont été utilisées. Toutes choses étant équivalentes par ailleurs, la formulation CHA3621-02 utilisée en 2007 semble aboutir à des niveaux de résidus inférieurs à ceux obtenus en 2005 avec la formulation CHA3619-02. Un effet du type de formulation sur le niveau de résidu ne peut donc être exclu.

Cependant, considérant :

- que les pratiques agricoles appliquées dans ces essais sont plus critiques que celles proposées (240 g/ha de substance active contre 200 g/ha proposées par application, 4 applications au lieu de 3, DAR de 28 jours au lieu de 35 pour 4 essais),
- que, dans la monographie, les niveaux de résidus obtenus sur betterave, une autre culture de type « racine », évalués au Nord et au Sud Europe pour des BPA voisines (voire plus critiques en zone Sud), se sont avérés voisins dans les deux zones,

il apparaît que le risque de dépassement de la LMR du diméthoate sur carotte en utilisant conformément aux BPA proposées (3 applications apportant 200 g/ha de substance active, effectuées à 7 jour d'intervalle et en respectant un DAR de 35 jours) des spécialités en formulation EC, est peu probable.

L'Agence française de sécurité sanitaire des aliments émet un avis favorable à l'octroi de la dérogation proposée dans les conditions précisées ci-dessus.

Pascale BRIAND

- Remarks:**
- (a) For crops, the EU and Codex classifications (both) should be used; where relevant, the use situation should be described (e.g. fumigation of a structure)
 - (b) Outdoor or field use (F), glasshouse application (G) or indoor application (I)
 - (c) e.g. biting and sucking insects, soil born insects, foliar fungi, weeds
 - (d) e.g. wettable powder (WP), emulsifiable concentrate (EC), granule (GR)
 - (e) GCPF Codes - GIFAP Technical Monograph No 2, 1989
 - (f) All abbreviations used must be explained
 - (g) Method, e.g. high volume spraying, low volume spraying, spreading, dusting, drench
 - (h) Kind, e.g. overall, broadcast, aerial spraying, row, individual plant, between the plants - type of equipment used must be indicated
 - (i) g/kg or g/l
 - (j) Growth stage at last treatment (BBCH Monograph, Growth Stages of Plants, 1997, Blackwell, ISBN 3-8263-3152-4), including where relevant, information on season at time of application
 - (k) The minimum and maximum number of application possible under practical conditions of use must be provided
 - (l) PHI - minimum pre-harvest interval
 - (m) Remarks may include: Extent of use/economic importance/restrictions

List of end points (based on doc 1654/VI/94, Rev. 7, 22 Apr 1998)

Residues

Rapporteur Member State	Month and year	Active Substance (Name)
UK	March 2006	Dimethoate

Analytical methods for residues (Annex IIA, point 4.2)

Food/feed of plant origin (principle of method and LOQ for methods for monitoring purposes)

Samples were extracted with dichloromethane, dimethoate and omethoate were determined by LC-MS. LOQ was 0.01 mg/kg for both dimethoate and omethoate in wheat, sugar beet, tomatoes, olives, olive oil and lettuce.

Samples were extracted with aqueous acetone, dimethoate and omethoate were determined by GC-FPD. LOQ was 0.01 mg/kg for both dimethoate and omethoate in sugar beet.

Samples were extracted with ethyl acetate, dimethoate and omethoate were determined by GC-FPD. LOQ was 0.01 mg/kg for both dimethoate and omethoate in lettuce.

Samples were extracted with acetone or ethyl acetate, dimethoate and omethoate were determined by GC-FPD. LOQ was 0.01 mg/kg for both dimethoate and omethoate sorghum, peas, wheat, corn, orange, potato, tomato (including various processed fractions for all crops).

Samples were mixed with hexane (olive oil) or ethyl acetate (olives, lettuce, orange and wheat grain) and then extracted with acetonitrile, dimethoate and omethoate were determined by GC-FPD. LOQ was 0.01 mg/kg for all crops.

Food/feed of animal origin (principle of method and LOQ for methods for monitoring purposes)

Samples were extracted with acetone or acetonitrile, dimethoate and omethoate were determined by GC-FPD. LOQ for both dimethoate and omethoate was 0.001 mg/kg (milk and egg white), 0.01 mg/kg (goat liver, kidney, fat) and 0.05 mg/kg in whole egg).

Residues

Rapporteur Member State	Month and year	Active Substance (Name)
UK	March 2006	Dimethoate

Residues

Metabolism in plants (Annex IIA, point 6.1 and 6.7, Annex IIIA, point 8.1 and 8.6)

Plant groups covered	Potato (R & L) and wheat (C), extrapolated to all groups
Rotational crops	Wheat (C) , lettuce (L) and turnip (R)
Plant residue definition for monitoring	Dimethoate plus omethoate
Plant residue definition for risk assessment	Dimethoate plus 6 x omethoate (acute) expressed as dimethoate Dimethoate plus 3 x omethoate (chronic) expressed as dimethoate
Conversion factor (monitoring to risk assessment)	

Metabolism in livestock (Annex IIA, point 6.2 and 6.7, Annex IIIA, point 8.1 and 8.6)

Animals covered	Goat and hen
Animal residue definition for monitoring	Dimethoate plus omethoate
Animal residue definition for risk assessment	Dimethoate plus omethoate
Conversion factor (monitoring to risk assessment)	
Metabolism in rat and ruminant similar (yes/no)	yes
Fat soluble residue: (yes/no)	No (log P _{ow} <4)

Residues in succeeding crops (Annex IIA, point 6.6, Annex IIIA, point 8.5)

.....	The studies show metabolism in succeeding crops is similar to that seen in primary crops.
-------	---

Stability of residues (Annex IIA, point 6 introduction, Annex IIIA, point 8 introduction)

.....	Dimethoate and omethoate residues have been shown to be stable when frozen between -10°C and -20°C for up to 27 months in potato, orange fruit, sorghum grain/forage and cottonseed as well as cherries stored for 6 months. These data are sufficient to cover the storage periods for the sample in the residues trials (wheat grain and straw – 9.5 months; olive – 6.5 months; sugar beet roots and tops – 8 months; Tomatoes – 5.5 months and protected lettuce – 4.5 months).

Formulation (e.g. WP) : EC
Commercial product (name) : Rogor (ZA 030326-00)
Applicant : Spiess-Urania Chemicals GmbH (SPU)

Active ingredient : Dimethoate
Crop / crop group : Carrots

Submission date : June 2001
Page : 001

Indoors / outdoors : Outdoors
Other a. i. in formulation (common name and content) : --
Residues calculated as : Dimethoate and metabolite Omethoate
